

Data sheet

Pressure operated water valve

Type WVFX and WVS

Pressure operated water valves types WVFX and WVS are used for regulating the flow of water in refrigeration plants with water-cooled condensers.

The pressure operated water valves give modulating regulation of the condensing pressure within defined limits during operation. When the refrigeration plant is stopped, the cooling water flow is shut off automatically.

Pressure operated water valves can be used with flammable refrigerants. Double sealing between the refrigerant and the water line ensures that in case the bellows damage and the refrigerant leak, it cannot enter into the water. This severely limits the safety implications. It means that the valve can be used together with a double walled heat exchanger and water circuit in such a system does not need to be considered as a part of the installation for flammable refrigerants (EN378-1:2008, clause 4.4.2.2).

Features

- Media: Fresh water and Neutral brine
- Refrigerants: HCFC, HFC and HC
- Needs no power supply – self acting
- Opens on rising condensing pressure
- Complete flow range from 1.4 – 300 m³/h
- Low flow version of WVFX – 0,63 m³/h, (available on request)
- Insensitive to dirt
- WVFX 10 – 25 are available in stainless steel housing
- Suitable for flammable refrigerants
- May be used in the following EX range: Category 3 (Zone 2)

¹⁾ The K_v value is the flow of water in [m³/h] at a pressure drop across valve of 1 bar, ρ = 1000 kg/m³.

²⁾ Fully open valve requires 33% higher pressure than a WVFX, range 3.5 – 16 bar.

³⁾ WVFX 15, WVFX 20 and WVFX 25 with stainless steel housing only.

⁴⁾ High pressure refrigerants version (45,2 MWP) only

⁵⁾ WVS, WVFX 10 – 25 and WVO with flare connection only; versions with capillary tube or with solder connections are not compatible with R717. WVFX 32 and WVFX 40 are not compatible with R717

WVFX 10 – 40 are direct actuated valves.
WVS 32 – 100 are servo-operated valves.

Media temperature range

WVFX 10 – 25: -25 – 130 °C

WVFX 32 – 40: -25 – 90 °C

WVS: -25 – 90 °C

If a WVS is required with an opening differential pressure of 1 – 10 bar, the valve servo spring must be replaced.

See "Ordering".

Opening differential pressure

WVFX 10 – 25:

max. 10 bar

WVFX 32 – 40:

max. 10 bar

WVS 32 – 40:

min. 0.5 bar;

max. 4 bar

WVS 50 – 100:

min. 0.3 bar;

max. 4 bar

Below 20% of max. capacity the WVS will act as an on-off regulator.

Installation

WVS and WVFX 32, WVFX 40 is to be fitted in the cooling water inlet with flow in the direction of the arrow and with the bellows element facing upwards. Horizontal mounting is a must.

WVFX 10, WVFX 15 and WVFX 25 can be mounted in any position. Horizontal mounting is not required.

Capacity

Water Valves Offset – rise in condensing pressure

Type	[bar] Δp
WVFX 10	2.0
WVFX 15	2.5
WVFX 20	3.0
WVFX 25	3.5
WVFX 32 – 40	3.0
WVS 32	0.6
WVS 40	0.7
WVS 50 – 80	0.8
WVS 100	0.9

The capacity curves show the capacities of individual valves (water quantity in m^3/h) depending on the pressure drop across valves.

The capacities given apply at 85% valve opening and are obtained with the following offset (rise in condensing pressure).

Design / Function

Condensing pressure impulses are transmitted via the bellows element to the valve cone so that the valve – even at very small pressure variations – is able to adapt the quantity of water required by the condenser.

The valves are pressure-relieved in such a way that a variation in the water pressure will not affect their setting.

To protect the refrigeration plant against high head pressures in the event that the water supply to the condenser fails, a safety switch type KP or RT should be fitted on the high pressure side.

Water side connections are internal BSP and the compressor discharge side connection is ¼ in. / 6 mm flare.

The valve body WVFX 10 – 25 is made of hot-stamped brass and for WVFX 32 – 40 of cast iron. WVFX 15, WVFX 20 and WVFX 25 can also be supplied in stainless steel housing.

All metal external valve parts are surface-treated to resist corrosion from condensate, etc.

It is possible to order reverse acting WVFX valve, which opens on refrigerant pressure decrease.

Reverse acting valve are mostly used in bypass lines and heat pump applications.

5. O-ring
6. Guide bush
7. Diaphragm
8. Valve cone
9. Thrust pad
10. Bellows element

The valve cone (8) is a brass plate with a vulcanized layer of artificial rubber to form an elastic seal against the valve seat. The valve is externally sealed by the diaphragms (7).

The top and bottom of the valve plate holder are extended by a guide that is fitted with O-rings (5) to ensure the internal operating parts move correctly. These O-rings, fitted in conjunction with the diaphragms, also provide extra protection against external leakage.

The valve seat is made of stainless steel and is pressed to the valve body.

The spring housing (2) is of aluminium and has a guide slot for the spring holder that is extended in the form of an indicating pointer. An associated indicator label is riveted to the housing and is graduated from 1 – 5.

14. Spring holder

The valve cone (7) is made of brass with a T-ring (6) of artificial rubber forming a flexible seal against the valve seat. The O-rings (8) are external seals for the cooling water.

The valve cone guide bushes (5) are specially treated to counteract lime deposits from the cooling water inside the cylinder, and also to reduce friction in the valve to a minimum.

The valve seat is made of stainless steel and is pressed to the valve body.

The regulating spindle (13) is mounted in a guide in the spring housing which has a notch for the spring holder (14). The spring holder also acts as an indicator.

WVS 32 – 40 valves have internal BSP connections, while WVS 50 – 100 can be supplied with either BSP connections or weld flanges.

Connection to the plant condenser can be made by copper tube or steel tube, the valves being supplied with both a flare nipple for 1/4 in. (6 mm) copper tube and a weld nipple for ø6 mm / ø10 mm steel tube.

The valve consists of three main components:

1. Main valve with servo piston
The main valve body is made of cast iron with a pressed-in bronze seat. The servo piston is of gun metal and has a sleeve and a profiled rubber seal ring.

2. Pilot valve
The pilot valve is made of gun metal, the pilot cone and seat of stainless steel and the pilot orifice of brass. These materials are particularly resistant to water corrosion. However, the valve is not resistant to sea water.

The strainer ahead of the pilot orifice is made of nickel gauze.

The degree of opening of the pilot valve (which corresponds to the increase in condensing pressure above the set opening pressure) determines the degree of opening of the main valve and thereby amount of the water flow.

3. Bellows unit with connection to condenser
The bellows unit is made of aluminium and corrosion-protected steel.

Sizing

When sizing and selecting water regulating valves it is most important to ensure that the valve at any time is able to give the necessary quantity of cooling water.

In general, the aim should be to select the smallest valve capable of giving the required flow.

To select a suitable size of valve it is necessary to know the precise amount of cooling required.

To obtain a precise control it can be recommended to only use 85% of the capacity. Below 85% the ratio between flow and condensing difference pressure is linear. Above 85% the ratio is no longer linear. To reach a 100% capacity the water valve needs significant increase of condensing pressure. See fig. below.

On the other hand, to avoid the risk of unstable regulation (hunting) the valve should not be oversized.

Offset

Type	Δp offset [bar]
WVFX 10	2.0
WVFX 15	2.5
WVFX 20	3.0
WVFX 25	3.5
WVFX 32 – 40	3.0
WVS 32	0.6
WVS 40	0.7
WVS 50 – 80	0.8
WVS 100	0.9

Valve size

The following data is used when selecting the size of the water valve:

- Cooling capacity of condenser
- Temperature rise in cooling media
- Differential pressure across valve
- Condensing temperature
- Specific heat capacity of cooling media
- Refrigerant

Sizing Examples

Example 1:

Condenser capacity Q_0 : 30 kW
 Condensing temperature t_0 : 35 °C
 Refrigerant: R404A
 Cooling media: water

Specific heat capacity of water C_p : 4.19 kJ/(kg*K)
 Water inlet temperature t_1 : 15 °C
 Water outlet temperature t_2 : 25 °C
 Pressure drop across valve Δ_p : max. 1.0 bar

Necessary mass flow	$\dot{m} = \frac{Q_c}{C_p \cdot (t_2 - t_1)} \cdot 3600 = \frac{30}{4.19 \cdot (25 - 15)} \cdot 3600 = 2577 \text{ kg/h}$
Volume flow	$\dot{V} = \frac{\dot{m}}{\rho} = \frac{2577}{1000} \approx 2.6 \text{ m}^3/\text{h}$

Selecting size

Selecting WVFX 20

Code number
The saturated pressure for R404A
 $T_c = 35\text{ °C} \Rightarrow P_c = 15.5\text{ barg}$

Choose a WVFX 20 with 4 – 23 barg range

Example 2:

Condenser capacity Q_c : 20 kW
Condensing temperature t_c : 35 °C
Refrigerant: R134a
Cooling media: Brine
Density of brine ρ : 1015 kg/m³

Specific heat capacity of water C_p : 4.35 kJ/(kg*K)
Water inlet temperature t_1 : 20 °C
Water outlet temperature t_2 : 25 °C
Pressure drop across valve Δp : max. 2.0 bar

Necessary mass flow	$\dot{m} = \frac{Q_c}{C_p \cdot (t_2 - t_1)} \cdot 3600 = \frac{20}{4.35 \cdot (25 - 20)} \cdot 3600 = 3310\text{ kg/h}$
Volume flow	$\dot{V} = \frac{\dot{m}}{\rho} = \frac{3310}{1015} \approx 3.26\text{ m}^3/\text{h}$
K_v value	$K_v \geq \frac{\dot{V}}{\sqrt{\frac{1000 \cdot \Delta p}{\rho}}} = \frac{3.26}{\sqrt{\frac{1000 \cdot 2.0}{1015}}} = 2.32\text{ m}^3/\text{h}$

Selecting size of WVFX 20
 $K_v \geq 2.32\text{ m}^3/\text{h} \Rightarrow$ **WVFX 20**
WVFX 20 has $K_v = 3.4\text{ m}^3/\text{h}$ and the necessary capacity is below 85% of full capacity

Code number
The saturated pressure for R134a
 $T_c = 35\text{ °C} \Rightarrow P_c = 7.9\text{ barg}$

Choose a WVFX 20 with 3.5 – 16 barg range
